

Obstacles to Self-Custody Among Bitcoin Businesses

Bitcoin treasury companies are so hot right now, but there are many companies all over the world who have been accepting bitcoin as payment and holding it on their balance sheets for years.

[Wizardsardine](#) makes a self-custodial Bitcoin wallet ([Liana Wallet](#)) that allows for easy multisig constructions that are well-suited to businesses. However, our current wallet UX is aimed at retail consumers. We are very interested in gaining insight about level of interest in self-custody among businesses and the pain points they most often experience when holding their own keys.

Research question:

What is the level of interest in bitcoin self-custody among businesses who are already know about Bitcoin, and for those that are interested in self-custody what are the greatest obstacles?

Methodology:

Collect current data (via survey, interviews, etc...) from businesses that hold, accept, or are interested in bitcoin in the EU or US to determine the major obstacles they experience to safely and easily taking and keeping custody of their bitcoin and how much they value self custody.

Some great places to start looking for such businesses might be:

- [Btcmap.org](#) lists over 10,000 businesses that accept bitcoin.
- [Bitcointreasuries.net](#) lists 197 entities holding bitcoin.
- Bitcoin VCs such as egodeath, Ten31, Fulgur, Stillmark, Epoch, TVP, Axiom, and others all invest in Bitcoin startups and list their portfolio companies on their websites.

Desired outcome:

1. Measure with some metric the level of interest companies have towards self-custody compared to custodial solutions. Are they already taking action to take sovereignty of their funds or are they fine to use a custodian? This would be really helpful to understand whether there is market demand for a solution to their pain points and develop a product and marketing strategy.
2. Identify specific pain points of self custody. Such pain points might have to do with accounting or regulatory burden or they may be practical such as key rotation when an officer departs the company or they may be technical such as coordinating transaction signing. Your research should attempt to identify specific, real-world problems such companies are experiencing or have experienced with self-custody.

Bonus: develop a marketing strategy for a Bitcoin wallet that solves some of these pain points for businesses that want to hold bitcoin in self custody.
