

- Title: Developing the Bitcoin options trading market

- Company: Thalex

- Business area: strategy and marketing

- In the Bitcoin and crypto market, most derivatives traders just trade the perpetual because it is perceived as easier and more approachable. However, options offer a much more advanced way to tailor the exposure you want to have (both for leverage and for hedging) and to generate a yield on your Bitcoin holding (e.g. covered calls). Options are also a better tool to protect your portfolio in case of increased market volatility as they allow you to pay a fixed premium upfront instead of having to continuously hedge during changing market conditions.

Thalex is a leading Bitcoin options exchange, and its goal is to convince retail perp traders to start trading options. This can be done through educational initiatives, improvement in the product UX and marketing campaigns. The goal of the case study should be to develop a comprehensive strategy on how to achieve the goal and a general narrative that can be pushed forward.

- Clear objectives: deliver a presentation with a strategy on how to get more crypto traders to trade options. This should include a narrative proposal and clear actions on how to push it in the community to get awareness and conversions.
